KIRILL SHABANOV

Middle Fullstack Developer | TypeScript, React, Next.js, Node.js, AI/LLM

Yekaterinburg, Russia | GMT+5 | Remote / Relocation
+7 993 104-30-66 | vortex.tttoo@gmail.com | github.com/unitdhda

PROFESSIONAL PROFILE

Fullstack developer with 5+ years of commercial experience building web applications with TypeScript, React, Next.js and Node.js. Built SSR applications with Next.js App Router, admin systems, internal data-processing tools, infographic builders, image-processing and AI/LLM pipelines, plus Telegram integrations. I use Claude, OpenAI Codex and Pi coding agent for task analysis, code generation and refactoring; I develop plugins and specialized tools for Pi. I independently own tasks from requirements and technology selection through implementation and deployment, participate in code review, and collaborate with clients, editors and designers.

KEY SKILLS

Languages and runtime: TypeScript, JavaScript, Node.js, Python, Rust

Frontend: React, Next.js, App Router, SSR, Redux, D3.js, Three.js, Pug

Backend and data: Express, PostgreSQL, Redis, REST API, Telegraf, Sharp.js, Whisper API

AI and agent systems: Claude, OpenAI Codex, Pi coding agent, LLM orchestration, tool calling, RAG-like retrieval pipelines, structured data extraction, semantic matching, evaluation, Pi plugin development

Testing and infrastructure: Jest, unit testing, Docker, Linux, Git, Vercel, deployment configuration

Practices: AI-assisted development, code generation and refactoring, code review, API integrations, stack selection, deployment configuration

WORK EXPERIENCE

Freelance and contract development

Fullstack Developer

March 2022 - Present

- Build SSR web applications with Next.js App Router, Telegram bots, AI/LLM pipelines, automation tools and interactive data visualizations.
- Independently refine requirements, choose the architecture and stack, implement frontend and backend, and configure deployment.
- Integrate external APIs and implement solutions with React, Next.js, TypeScript and Node.js.
- Use Redux for state management and Jest for unit testing; work with Docker and Linux in development and deployment.
- Use Claude, OpenAI Codex and Pi coding agent for task analysis, code generation, refactoring and faster development iterations.
- Develop plugins and custom tools for Pi coding agent: add specialized context, tools and actions that automate repetitive operations.

WORK EXPERIENCE - CONTINUED

Telegram bot for job search, scoring and resume tailoring

Pet project | TypeScript, Node.js, Telegram / Telegraf, AI/LLM pipeline

- Collects and normalizes job postings from multiple sources, extracts requirements and converts postings and resumes into structured profiles.
- Uses a RAG-like retrieval pipeline and semantic matching to find relevant jobs, score fit and provide explainable ranking.
- Identifies candidate strengths and gaps relative to a vacancy and tailors the resume to the request without adding unsupported facts.
- Orchestrates LLM calls and tool calling for data extraction, matching, recommendation generation and result validation.

zona.media

Frontend / Fullstack Developer

October 2020 - September 2024

Development team: 5 people. Concurrent engagement with Jetstyle until January 2021.

- Developed an admin panel with React, TypeScript and Redux for 50 editors; maintained related server integrations.
- Built SSR applications with Next.js App Router, including an internal tool for data preparation, charting and rapid infographic creation - similar to part of Tableau's workflows.
- Developed a Pug template system for daily publication of 2-3 major pieces and about 50 news items.
- Developed Jest unit tests for an image-processing pipeline, enabling a safe migration of Open Graph image generation and the graphics builder from ImageMagick to Sharp.js; reduced generation time 3x, replaced system subprocesses with an API and simplified maintenance.
- Created interactive data-driven pieces with D3.js and Three.js.
- Developed a Telegram bot with Node.js and Telegraf for transcribing audio files via Whisper with durations of 30-40+ minutes.
- Worked with Docker and Linux, participated in peer code review, made stack decisions and configured deployment.

Jetstyle

Frontend Developer

June 2019 - January 2021

Team: 15-20 specialists.

- Participated in redesigning the web studio's corporate website and migrating the frontend to Next.js.
- Developed a reusable React component library for the design system.
- Developed interfaces and maintained Jest unit tests.
- Worked with Docker and Linux as part of a cross-functional team and maintained the shared frontend codebase.

EDUCATION

Unfinished Bachelor's, Mathematics | Ural Federal University | 2022

LANGUAGES

Russian - Native | English - C1
